Moscow. *Skin lesions in lymphogranulomatosis of Paltauf-Sternberg (Russian text) VESTN.VENER.DERM. 1956, 4 (57-58)

In a male patient aged 61, the rash on the face, neck, trunk and limbs resembled clinically lichen ruber moniliformis Kaposi and histologically the morbus lichenoides moniliformis Wise-Reis. There was enlargement of the axillary lymph nodes. The patient died with symptoms of progressive cardiac failure. The autopsy established the diagnosis of lymphogranuloma Paltauf-Sternberg (Hodgkin's disease). The skin lesions had a non-specific character. The authors failed to find description of a similar case in the literature. Of special interest was a complete absence of itching, commonly regarded to be a typical symptom in the skin lesions of Hodgkin's disease. Belenki - Moscow

AUTHOR: Kocharli, K. Sh.; Zeynally, A. Kh.; Belen'kiy, G. L.

TITLE: The energy structure of antimony selenide

SOURCE: Baku, Azerbaydzhanskiy gosudarstvennyy universitet. Uchenyye zapiski. Seriya fiziko-matematicheskikh nauk, no. 2, 1963, 83-87

TOPIC TAGS: antimony selenide, semiconductor, activation energy, activated crystal, impurity conductivity

ABSTRACT: The purpose of this [illegible] was to investigate the energy spectra of discrete states in Sb_2Se_3. The investigated partially compensated Sb_2Se_3 were single crystals which displayed p-type conductivity. The Sb_2Se_3 single crystals were prepared by a procedure described previously [Fizika tverdogo tela, 1, No. 6, 979 (1959); Uchenyye zapiski AGU, no. 1, 37 (1959)]. All measurements were conducted along the b axis of the specimens to which graphite [illegible] electrodes were attached. In this work the width of the forbidden zone [illegible] was found to be $\Delta E_0 = 1.12$ ev [illegible]

natural conductivity region. The impurity levels with the following activation energy levels were determined:

E_1 = 0.017 ev, E_2 = 0.18 ev, E_3 = 0.3 ev, E_4 = 0.53 ev.

The calculated capture cross section for the level 4, which is considered to be the principal recombination level, was found to be $S = 3 \cdot 10^{-18}$ cm^2. Orig. art. has: 4 figures.
